As a result, the *labeled* and *unlabeled* data are combined into a single *labeled* dataset. This is done by concatenating the *labeled* and *unlabeled* data frames. The resulting *labeled* data frame contains all the data from both the *labeled* and *unlabeled* data frames, with the *label* column indicating whether each data point is labeled or unlabeled. This allows for a more efficient and accurate training of the model, as it can now learn from both labeled and unlabeled data simultaneously.
